

In the beginning of April 2019, from the 1st to the 6th, a part of the CLElab (Collège Lycée Experimental LABORatory) class went to Italy at the city of Frascati for a European training session called INSPYRE. During this internship, the class assist at 40 hours of conferences and activities about modern physics. INSPYRE means **I**nternational **S**chool on modern **Ph**ysics and **R**esearch. The project is called like that because his first goal is to inspire the new

generation of students interested by physics. The training session is organised in the laboratory called INFN (Istituto Nazionale di Fisica Nucleare). In the first day we met the director of the INFN and the organisers of INSPYRE. We participated at an speed-dating, we met the half of the 90 students which came from everywhere in the world. We listened our first conference, not the easier, presented by Antonio Polosa. The second day we listened to 6 conferences and visit Daphne, the particle

accelerator of the laboratory. The third day and the fourth, we participated to times dedicated to experiments in the morning. We listened to conferences, to a « lectio magistralis » and we visit the visitor center. The last day we got our certificates and we assist at the last conferences. For

the class, this experiment was very interesting but too refine our knowledge. That's also important for our future carriers even if we don't keep studying physics. This training session was a good social experiment for us and that allow to meet people who've the same center of interest and create new relationship.
